                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           suppressor gene BRG1 in cancer diagnosis and therapy. This gene is comprised of several exons, shown in AACS8874-C58903, and has several splice variants, given in AACS8806-C58912. The protein sequences for these are shown in AAB27552-BS7558. BRG1 is a homologue of the Drosophila protein brahma, and has been shown to be bound to retinoblastoma tumour apprecian represent RB. The BRG1 coding sequence and protein can be used in the diagnosis and treatment of cancer (for example by gene therapy); particularly prostate cancer, to identify drugs useful in the treatment of cancer and in the production of animal models for cancer. Sequences AACS8849-C58873 are all primers used in the isolation and sequencing of the BRG1 gene and its variants.
                                    The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion Kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, angiogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; BRG1; tumour suppressor gene; cancer; chromosome 19p13.1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion Kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, angiogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense compounds for inhibiting focal adhesion kinase expression, especially useful for inhibiting retinal neovascularization, or for diagnosing and treating e.g. colon cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides a method of diagnosing a vascular disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       In an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification.

The invention concerns novel splice variants of the melanocortin 1 receptor (MC-R1) protein belonging to the rhodopsin sub-family of G-protein coupled receptors. The splice variants, referred to as MC-R1B proteins, contain an intracellular domain with an additional 65 amino acid residues in comparison to previously disclosed human MC-R1, referred to as MC-R1B, additionally, residue 317 of the MC-R1B proteins is Cys, whereas the C-terminal amino acid residue 317 of the MC-R1B proteins is Cys. Trp. The novel sequences can be used to determine whether a substance antagonists of MC-R1B. Pharmaceutical compositions comprising modulators of MC-R1B are used to treat or diagnose disorders involving
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MC-R1; melanocortin 1 receptor; rhodopsin; G-protein coupled receptor; splice variant; MC-R1B; C-terminal extension; agonist; antagonist; modulator; PCR primer; ss.
                                                                                                                                                                   New nucleic acid encoding a human melanocortin 1 receptor protein (MC-R1B) for determining whether a substance is capable of binding to or activating human MC-R1B and identifying a substance that modulates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                          receptor (MC-R1) protein belonging to the rhodopsin sub-family of expotein coupled receptors. The splice variants, referred to as MC-R1B proteins, contain an intracellular domain with an additional 65 amino acid residues in comparison to previously disclosed human MC-R1, referred to as MC-R1A. Additionally, residue 317 of the MC-R1B proteins is Cys, whereas the C-terminal amino acid residue 317 of known MC-R1B proteins is Trp. The novel sequences can be used to determine whether a substance antagonists of MC-R1B receptor activity and to identify potential agonists or modulators of MC-R1B are used to treat or diagnose disorders involving inappropriate melanocortin expression or activity.
                                                                                          New nucleic acid encoding a human melanocortin 1 receptor protein (MC-RIB) for determining whether a substance is capable of binding to or activating human MC-RIB and identifying a substance that modulates MC-RIB receptor activity
                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                  The invention concerns novel splice variants of the melanocortin 1
                                                                                                                                                                                                                                                                                                                                                         ö

```
A human placental genomic DNA library cloned into the phage vector lambda EMBL3/SP6/T7 was screened with the human heavy chain J region specific oligonucleotide probe and the phage clone lambda 1.3 isolated. A 6 kb HindII/KpuI fragment from this clone, contg. all six J segments as well as D segment DHQ22 and the heavy chain J-mu intronic enhancer was isolated, and ultimately used to construct an IGM expressing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A 6.3kb BamHI/HindIII fragment that includes all J segments was isolated from human genomic DNA library using probe AAQ44160. An adjacent 10kb HindIII/BamHI fragment that contains enhancer, switch and constant region coding exons was similarly isolated using the probe AAQ44161 and an adjacent 3' 1.5kb BamHI fragment was isolated using pMUM insert as probe and cloned into pUCl9. (pMUM is a 4kb EcoRI/HindIII fragment isolated from human genomic DNA library with oligonucleotide AAQ44162 mu membrane exon 1). All three fragments are used in the construction of plasmid pHIG1 which contains an 18kb insert encoding J and C-mu segments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Phage clone lambda 1.3 was isolated. A 6kb HindIII/KpnI fragment from this clone, containing all 6 J segments as well as D segment DH022 and the heavy chain J-mu intronic enhancer, was isolated. The same library was screened with the human mu specific oligonucleotide 044181 and phage clone mu switch region and all of the mu constant region as and all of the mu constant region as solated from this clone. The two fragments were ligated together
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  th KpnI/XhoI digested pNNO3 to obtain plasmid pJMI which was used the construction of IgM expressing minilocus transgene pIGM1.

                                                                                                                                                                      chain J region, which was used in the construction of a IgM heavy chain minilocus transgene. The transgene was injected into mouse embryo pronuclei to generate transgenic mice, which can be used for the production of heterologous (i.e. human) antibodies against specific antigens, this comprises immunising a mouse with a preselected antigen and collecting antigen binding heterologous
                                                                                                                                           The present sequence is a probe specific for a human antibody heavy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

                                                                                                                                                                                                                                                                                                     BamHI/Hindill fragment that includes all human antibody J segments. The fragment isolated using the probe was used in the construction of a heavy chain minilocus transgene. The transgene, which contains human immunoglobulin heavy chain coding sequences, can be injected into mouse embryo pronuclei to generate transgenic mice. The mice can be used for the production of heterologous (i.e. human) antibodies against specific antigens, this comparises immunising a mouse with a preselected antigen and

This sequence represents a probe for the human junction (J) region genes. The identified sequence is used in the plasmid pRE3, which is used to develop the transgenic mouse of the invention contains in its genome a transgene comprising in mouse of the invention contains in its genome a transgene comprising in operable linkage human variable (V), diversity (D) and J genes, a human of mu constant region gene (muCH), at least 2 different non-mu human CH genes and associated isotype switching sequences, where human mu and gamma switch sequences are located in closer proximity to each other than in the naturally occurring human immunoglobulin (Ig) locus, and where in lymphocytes of the mouse the transgene undergoes productive VDJ rearrangement and mu to gamma isotype switching by recombination between the human mu and gamma sequences, so that the mouse produces a serum containing Ig of at least 3 human hawy chain isotypes in response to antigenic stimulation. The transgenic mice can be used to produce human contigens. The MAD can be used in therapeutic or diagnostic human antigens. The transgenic mice can produce human MAD of multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

A novel composition has been developed which comprises an immunoglobulin (Ig) having an affinity constant (Ra) of at least 2 multiply 10000000000 M-1 for binding to a predetermined human antigen. The 1000000000 M-1 for binding to a predetermined human antigen. The present sequence represents a probe used to screen a human placental genomic DNA library cloned into the phage vector lambdaEMBL3/SP6/T7, for the human heavy chain J region. Anti-CD4 antibodies may be used in therapeutic and diagnostic applications, especially for the treatment of human diseases. These antibodies reduce activity of CD4 cells and transplant rejection. Transgence animals are capable of producing heterologous antibodies of multiple isotypes by undergoing isotype switching. These animals produce a first ig type that is necessary for antigen-stimulated B-cell maturation and can switch to encode and produce one or more subsequent heterologous isotypes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A novel composition has been developed which comprises an immunoglobulin (Ig) having an affinity constant (Ka) of at least 2 multiply
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This oligonucleotide was used as a probe to facilitate in the cloning of a J-mu region from a human immunoglobulin. The probe isolated a 6.3 kb BamH/HindIII fragment from a human genomic library which included all joining (J) segments. This region is used in a novel method of developing transgenic non-human animals capable of producing heterologous antibodies encoded by human immunoglobulin genes. Such transgenically produced monoclonal antibodies should alleviate the intrinsic immunogenicity of non-human immunoglobulins allowing the

1000000000 M-1 for binding to a predetermined human antigen. The present sequence represents a probe used for the isolation of human J segments from a human genomic DNA library. The anti-CD4 entibodies may be used in therapeutic and diagnostic applications, especially for the treatment of human diseases. These antibodies reduce activity of CD4 cells and reduce undesirable autoimmune reactions, inflammatory response and transplant rejection. Transgenic animals are capable of producing heterologous antibodies of multiple isotypes by undergoing isotype switching. These animals produce a first Ig type that is necessary for antigen-stimulated B-cell maturation and can switch to encode and produce one or more subsequent heterologous isotypes.

                                                                                                                                                                                              ö
                        The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, anglogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic autisense development disorders, angiogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense compounds for inhibiting focal adhesion kinase expression, especially useful for inhibiting retinal neovascularization, or for diagnosing and treating e.g. colon cancer

The sequences given in AAT58071-85 represent oligonucleotides which are antisense to sequences contained in the pre-mRNA or mature mRNA transcript of human intercellular adhesion molecule-1 (ICAM-1).
                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                          These oligonucleotides may be used for treating septic shock and the manifestations of septic shock, e.g. inflammation, and vascular and tissue defects. They are also useful in the treatment of septic shock associated diseases, e.g. adult respiratory distress syndrome,

gene for use in

Itoh

Suzuki M,

Ohshima T,

```
This invention relates to a mouse containing the human cytochrome P450 gene (from the CYP3A family). PCR primers AAF93356 - AAF9241 are used in camples illustrating the construction of vectors used in the production of the transgenic mouse of the invention. The mouse can be used for studying human drug efficacy, metabolism and toxicity, including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         nucleotide encoding an APJ protein and/or a nucleotide encoding the CD4 protein, such that the cells coexpress APJ and CD4. The APJ receptor (AAM87466) is an orphan seven transmembrane domain receptor that has been found to function as an efficient coreceptor for cellular infection by a number of HIV-1 and SIV strains. The entry of HIV into cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to recombinant eukaryotic cells transformed with a

or mature RNA transcript of human intracellular adhesion molecule
(ICAM). E-selectin or vascular cell adhesion molecule (VCAM).
It can be used to inhibit expression of these proteins. Inhibition
of these proteins forms the basis for treatment of conditions and
diseases that have an inflammatory component, e.g. acne, psoriasis,
arthritis, organ rejection, wounds, burns, septic shock or
inflammatory complications of septic shock.

involves binding of the viral envelope protein (env) to CD4, followed by interaction with a coreceptor. Binding to the coreceptor triggers a conformational change in env that mediates fusion between the viral membrane and the host cell membrane. The invention also encompasses peptides and antibodies which specifically bind to an extracellular domain of APJ. These inhibit membrane fusion between a cell coexpressing the APJ and CD4 proteins and a cell expressing an HIV env protein and the APJ and a cell expressing and the APJ inhibits HIV infection of the APJ/CD4-expressing cell. The new recombinant cells provide an important tool for investigating and controlling HIV infection. The cells can be used to identify compounds that modulate interaction between HIV and an APJ receptor, which may be useful in the development of anti-HIV drugs. Contacting cells expressing APJ and CD4 with an APJ binding/Dlocking agent (e.g., the antibodies or peptides) may be useful to inhibit HIV infection of such cells, e.g., to treat subjects having an HIV-related disorder associated with APJ expression. Antibodies and peptide fragments can be included in medians and administered to treat patients (especially foctuses) having, or at risk of developing, an HIV infection or related disorder. The antibodies can also be used detect cells expressing the APJ receptor, which are useful to diagnose susceptibility to HIV infection or related disorder. The art subjects are useful to diagnose susceptibility to medicion or related disorder. The art used to a susceptibility to the APJ receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                               higher APJ levels in central nervous system tissues may indicate an increased risk of neuropathogenesis associated with HTV infection. Transgenic animals which express human CD4 and APD proteins may provide model systems for the study of HTV infection and for anti-HTV drug development. Sequences AAA10299-A10300 represent PCR primers used in an terminal repeat) DNA sequences from CD4/APJ-expressing cells which had been previously exposed to HTV-1. The amplified LTR DNA was detected via

Sequences AAA72437, AAA72449-A72461, AAA72468 and AAA72474-A72477

represent cDNAs encoding novel plant isoflavone synthases (AAB21052 and AAB21054- AAB21071). AASO discolosed is the soybean cytochrome P450

monocoxygenase CYP93C1, encoded by a known sequence (AAA72444, NCBI No. 2739005), which was identified in the present invention as having isoflavone synthase expression constructs, transformed host cells, and transgenic plants and seeds conscribing the novel CDNA sequences of the invention. The invention also constructs, transformed host cells, and transgenic plants and seeds conscribing isoflavone synthase expression in a host cell, altering isoflavoned in a plant, and identifying nucleic acids encoding other plant isoflavone synthases. Isoflavone synthase cells, altering isoflavonoid levels in a plant, and identifying nucleic acids encoding other plant isoflavone synthases. Isoflavonoids are cells as key roll in the biosynthesis of isoflavonoids is soflavonoids are a class of secondary metabolites mainly produced in leguminous plants by a branch of the phenylpropanoid pathway. Isoflavone synthase catalyses the first step in the branch of this pathway that commits metabolic intermediates to the synthesis of isoflavonoids. Isoflavonoids is participate in the defence response of legumes against phytopathogenic intermediates to the synthesis of isoflavonoids. Isoflavonoids consumption of legumes and rhizobial bacteria which eventually result in nodulation and nitrogen fixation. They have also been shown to act as artibiotics, repellents, attractants, and signal compounds, and consumption of legume isoflavonoid synthases, and nucleic acids encoding them are useful for altering the levels of isoflavonoids produced in legumes such as soybean, and for the production of isoflavonoids produced in altering the levels of isoflavonoids produced in legumes such as soybean, and for the production of isoflavonoids camplification of the invention to amplify DNA encoding synthase; in the actual actual actual actual actual 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                            Nucleic acids encoding isoflavonoid synthases, useful for producing transgenic plants with increased production of isoflavonoids which are involved in defense against phytopathogenic microorganisms -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Insecticidal protein; Bacillus thuringiensis; monocotyledonous plant; structural gene; maize; CryI(b); CryIIB; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present sequence was used in the development of a novel system, comprising an adeno-associated virus (AAV) vector containing a foreign DNA, and the rep 68/78 sequence of AAV, the expression of which is delayed. The components may be present in cis (in a single agent) or in trans (in separate agents). The system is used for production of AAV vectors, particularly for gene therapy. The foreign DNA may encode a therapeutic protein, e.g. interferon, interleukin, growth factor, coagulation factor or metabolic enzyme, particularly one that increases the immunogenicity of tumour cells, and/or a diagnostic protein. The system produces AAV vectors on a large scale. It is based on the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 discovery that the rep68 and 78 proteins interfere with replication of AAV DNA, and that this interference is overcome by delaying expression of these proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   System of adeno-associated viral vector and rep 68/78 sequence of this virus - expression of which is delayed until replication of viral DNA has started, provides large scale production of vectors

                                                                                                                                                                                                               The present sequence represents a primer used in the present invention describing new structural genes capable of being expressed in a monocotyledonous plant. The new genes comprise modified nucleotide sequences which encode insecticidal proteins of Bacillus thuringiensis. The genes have been modified to reduce the usage of codons that are rare or semi-rare in monocotyledon DNA, thereby increasing transformation efficiency and/or increasing accumulation of the insecticidal protein in monocotyledon tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel nucleic acids, useful for transgenic plant production which is capable of expressing increased levels of desired proteins -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to nucleotides 669-1348 of a B.thuringiensis CryIA(b). The invention is useful for transgenic plant production, e.g. maize, capable of expressing increased amount of transgenic protein, e.g. crystal protein toxin gene
                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

The present sequence is one of a number of antisense compounds of up to phosphoenol pyruvate carboxykinase-cytosolic (PEPCK-cytosolic). The antisense compounds are useful for inhibiting the expression of PEPCK-cytosolic in cells or tissues. They are commonly used as research reagents and in diagnostics, e.g. to elucidate the function of particular genes. They are also useful for distinguishing between functions of various members of a biological pathway and for research use. The antisense compounds are also useful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence is a chimeric phosphorothioate oligonucleotide with 2'-MOE wings and a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                detector oligonucleotide of the invention. The detector oligonucleotide comprises a single-stranded target-binding region and an intramolecularly base-paired secondary structure linked to two dyes (donor and acceptor fluorophores). In the secondary structure, fluorescence of the donor is quenched, but when it is linearised or unfolded a change in some fluorescence parameter becomes detectable. A target nucleic acid is detected by hybridizing it to a detectable. A oligonucleotide in which the secondary structure is 5' to the target binding region, primer extension to produce a complementary strand using the secondary structure as template, resulting in linearization or oligonucleotide are used to detect (by primer extension and hybridization) and amplify (as signal primer) target sequences, e.g. for

The sequences given in AAQ86220-21 are primers which were used in the construction of a Sindbis glucocerebrosidase (GC) vector producing cell line. These primers amplify a 521 bp fragment for GC screening of the transformant cell lines. The cell lines contain alphavirus vectors which express multiple heterologous genes. The vectors are eukaryotic layered vector initiation systems (ELVIS) derived from Sindbis. ELVIS's comprise a 5' sequence capable of initiating transcription of an alphavirus, a nucleotide sequence encoding alphavirus non-structural proteins, a viral junction region which has been inactivated such that viral transcription of the subgenomic fragment is prevented, and an alphavirus RNA polymerase recognition sequence. Inactivation of the viral junction region prevents transcription of the subgenomic fragment making vectors such as this transcription of systic fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Eukaryotic layered vector initiation system; Sindbis; alphavirus; PCR; transcription initiation; non-structural protein; subgenomic fragment; RNA polymerase recognition sequence; ELVIS; gene therapy; amplify; primer; polymerase obinin reaction; cystic fibrosis; glucocerebrosidase; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  õ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cosmids by automated sequencing without intermediate subcloning.

A sample of 371 DNA sequence fragments were determined and of these, 277 were suitable for STS primer prediction by computer analysis (using the "Primer" program available from E.Lander, MIT).

The STSs and cosmids were mapped by in situ hybridisation, somatic cell hybrid analysis or both. Using this method, 370 STSs specific for human chromosome 11 were generated and most of them were regionally mapped; This procedure illustrates a novel method for sequencing complex genomes, designated "sequence sampled mapping".

The sequence sampled mapping method is useful for the completion of high density sequence-based maps, and ultimately, for the complete sequencing of genomic DNA directly from cosmid clones.

See AAQ82001-Q82706 and AAQ91325-Q91358 for STS primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Eukaryotic layered vector initiation system; Sindbis; alphavirus; PCR; transcription initiation; non-structural protein; subgenomic fragment; RNA polymerase recognition sequence; ELVIS; gene therapy; amplify; primer; polymerase obain reaction; cystic fibrosis; glucocerebrosidase; ss.

XX

CC construction of a Sindbis glucocerebrosidase (GC) vector producing

CC construction of a Sindbis glucocerebrosidase (GC) vector producing

CC cell line. These primers amplify a 521 bp fragment for GC screening

CC the transformant cell lines. The cell lines contain alphavirus

CC cell line. These primers amplify a 521 bp fragment for GC screening

CC the transformant cell lines. The cell lines contain alphavirus

CC eukaryotic layered vector initiation systems (ELVIS) derived from

CC sindbis. ELVIS's comprise a 5's equence capable of initiating

CC transcription of an alphavirus, a nucleotide sequence encoding

CC alphavirus non-structural proteins, a viral junction region winch

CC has been inactivated such that viral transcription of the subgenomic

CC fragment is prevented, and an alphavirus RNA polymerase recognition

CC sequence. Inactivation of the viral junction region prevents

CC transcription of the subgenomic fragment making vectors such as this

CC suitable for a wide variety of applications, eg. gene therapy for the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 45,

Sequence 374, Application US/09042353
Fatent No. 6255458
GENERAL INFORMATION:
APPLICANT: Lonberg, Nils
APPLICANT: Ray, Robert M.
TITLE OF INVENTION: Transgenic No. 6255458-Human Animals for TITLE OF INVENTION: Producing Heterologous Antibodies
NUMBER OF SEQUENCES: 421
CORRESPONDENCE ADDRESS:
ADDRESSEE: Townsend and Townsend and Crew LIP
STREET: Two Embarcadero Center, Eighth Floor
CITY: San Francisco
STATE: California
                                                                                                                                                                                                                                                                                                                                        COUNTRY: USA
ZIP: 94111-3834
COMPOTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPOTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/AKS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1.30
CURRENT APPLICATION DAFA:
APPLICATION NUMBER: US/09/042,353
FILING DATE: 13-MAR-1998

GENERAL INFORMATION:
APPLICANT: Griffals, R.
TITLE OF INVERTION: Chlamydia pneumoniae genomic sequence and polypeptides, fragme
TITLE OF INVERTION: thereof and uses thereof, in particular for the diagnosis, pr
TITLE OF INVERTION: and treatment of infection
FILE REFERENCE: 9710-003-999
CURRENT APPLICATION NUMBER: US/09/198,452A
CURRENT FILING DATE: 1998-11-24
NUMBER OF SEQ ID NOS: 6849
SEQ ID NO 3994
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      POLICES, Greg

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 1
